Troubleshooting 35

Web Browser Programming

Accessing the Web Interface when connected through DHCP 23

Wall Mount Installation

1. Remove the cover of the wiring panel (Fig 1).
2. Mark the four drilling points on the wall based on the drawing above.
3. Drill the holes for the anchors supplied in the mounting kit at the designated markings from step 1.
4. Install the four anchors in the holes that were just drilled.
5. Install the first two screws in the top holes leaving 1/8" of the thread exposed.
6. Line up the top key slots over the screws and lock the master clock into place.
7. Install the bottom screws through the wiring access panel and tighten into place.
8. After all wiring is complete, re-install the wiring panel cover.

Rack Mount Installation

1. The master clock is 1U in size. Install the threaded nuts in the desired location in the rack rails.
2. Put the nylon washers on the two screws supplied.
3. Line up the master clock with the threaded nut.
4. Insert screws into the threaded nuts and tighten.

Before You Get Started

Installing the Master Clock with the Line Cord Receptacle

1. The square knockout on the wiring chassis must be removed.
2. The Heyco Bushing must be attached to the power cord as shown. Use pliers to push both halves of the bushing together while they lock.
3. Put the wires through the knockout and push the bushing into the metal until it locks tightly into place. The wrod Heyco on the bushing faces up.
4. Put each wire into the supplied connector and tighten the screws. The wiring label located on the chasssis will show where to connect the wires.

AC Power Wiring using 14 AWG Romex Cable

Caution! The AC Power Source must be turned OFF.

1. Remove a round knockout on the wiring chassis, preferably one near the AC Input Connector.
2. Install a standard ½" Romex Bushing and tighten in place.
3. Pass the Romex Cable through the Bushing and clamp in place. Do Not over tighten the screws.
4. Strip back the outside cable sheathing to expose the White, Black and Ground wires.
5. Strip back the insulation on the White and Black wire ¼".
6. Put each wire into the supplied connector and tighten the screws. The wiring label located on the wiring chassis indicates where to connect the wires.

Rear View of Unit

- 1 N/A
- 2 N/A
- 3 **Clock 1 & 2 Sync-Wire Outputs** This terminal block is where connections would be landed for Clock 1 and Clock 2 sync-wire communication relay outputs.
- 4 **RS485 Input/Output** This terminal block is where connections would be landed for RS485 communication to and from other Sapling systems.
- 5 **Inputs** This terminal block is where connections would be landed to use the SMA as a slave clock when being controlled by another system.
- 6 **Remote RF Antenna (Rack Mount only)** This terminal block is where the connection to an external RF antenna would terminate.
- 7 **Ethernet** This RJ45 jack is used for connecting the master clock to a network for programming and/or timekeeping capabilities.
- 8 **GPS Connector** This GPS connector is where the antenna for the GPS gets mounted to (GPS option only).
- 9 **RS232 Port** This RS232 port is used for debugging only.
- 10 **Power Input** This power outlet is used to power up the SMA master clock.

Installing the Remote Antenna

When the rack mount master clock and the wireless option are ordered, the package includes a remote antenna. In order for the clock to send out the wireless signal to the surrounding slave clocks, the remote antenna must be installed. Follow the below directions for installation.

Notes: Use CAT5 ethernet cable. 50 foot maximum length. Use the wire colors as shown above. Note that Pin 1, Pin 4 and Pin 6 use a wire pair and Pin 2 and 3 are single wires.

- 1) Strip the insulation back 1/4 inch on all wires and twist the 2 wires together of each pair.
- 2) Pass the cable through a bushing in the wiring chassis.
- 3) Insert the wires into the connector and tighten the screws.

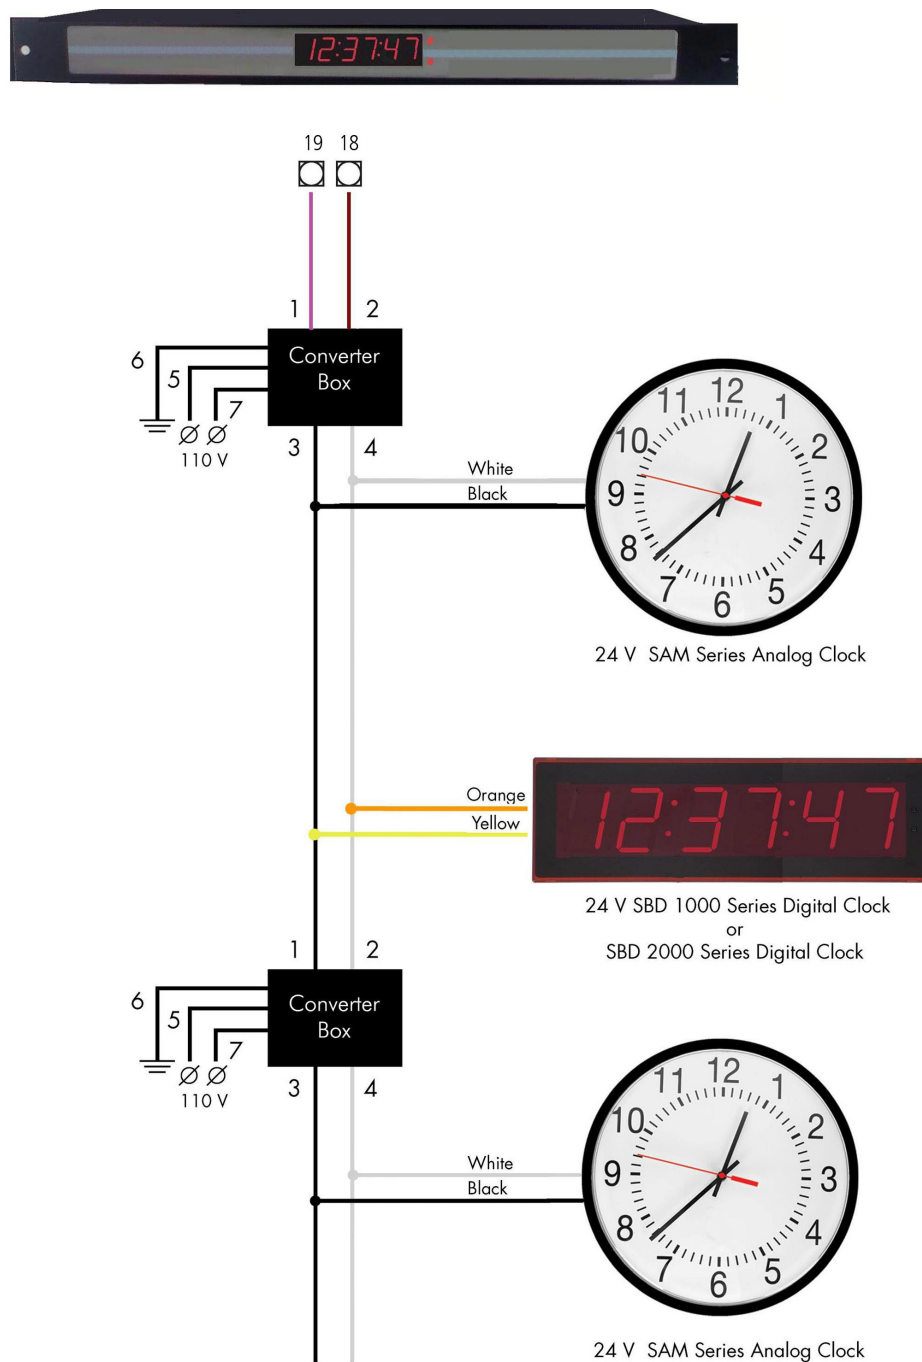

Remote Antenna Mounting Instructions

1. Remove the cover of the wiring panel.
2. Mark the four drilling points on the wall based on the drawing above.
3. Drill the holes for the anchors supplied in the mounting kit at the designated markings from step 1.
4. Install the four anchors in the holes that were just drilled.
5. Install the first two screws in the top holes leaving $1/8''$ of the thread exposed.
6. Line up the top key slots over the screws and lock the master clock into place.
7. Install the bottom screws through the wiring access panel and tighten into place.
8. After all wiring is complete, re-install the wiring panel cover.

Dry Contact Closure

Fire Alarm Interface Installation / Patch Cable Installation

Fire Alarm Interface Installation

The Fire Alarm Interface allows a relay closure to be connected to the SMA master clock that allows the user to interface the existing fire alarm with the Sapling SBD 1000 or SBD 2000 series digital clocks.

When a relay closure occurs on pins 9 and 10, "FirE" will display on the digital slave clocks connected using RS485 or two wire digital communication.

Patch Cable Installation

Fig 1.1

- 1) Connect a patch cable to the RJ45 port on the SMA Master Clock as shown in Fig 1.1.
- 2) Connect the other end of the patch cable to an Ethernet jack connected to the network.

User Level Programming

Setting the Time from the LED Display

To set the time, press the top button to change the hour and/or the bottom button the set the minute.

See Fig 2.1.

Fig 2.1

Programming the SMA 2000

To enter programming mode, press both the top and bottom button together simultaneously. The top button advances through the options while the bottom button changes the option.

Option 1 - Set Year:

Use the bottom button to scroll from "00-99" on the display and set the year.

Option 2 - Set Month:

Use the bottom button to scroll between "01-12".

User Level Programming

3 - 28

Option 3 - Set Day:

Use the bottom button to scroll between "01-31".

10 - 08

Option 10 - Technical Mode:

If technical mode is desired, press the bottom button until "08" is reached. Setting option 10 to "08" will allow the user access to options 11-13 when the top button is pressed. Any other value will go directly to option "20" when the top button is pressed.

11 - 03

Option 11 - RS485 Data Rate:

Press the bottom button to scroll between "01-12".

01 - Data is transmitted every second	07 - Data is transmitted every 2 minutes
02 - Data is transmitted every 5 seconds	08 - Data is transmitted every 5 minutes
03 - Data is transmitted every 10 seconds	09 - Data is transmitted every 10 minutes
04 - Data is transmitted every 15 seconds	10 - Data is transmitted every 15 minutes
05 - Data is transmitted every 30 seconds	11 - Data is transmitted every 30 minutes
06 - Data is transmitted every minute	12 - Data is transmitted every hour

12 - 2

Option 12 - Daylight Savings Time:

Press the bottom button to scroll between "d", "1", or "2".

"d" will disable this option.
"1" will enable daylight savings pre 2007.
"2" will enable daylight savings post 2007.

13 - 12

Option 13 - 12/24 Hour Mode:

Press the bottom button to scroll between "12" and "24".

User Level Programming

20--7

Option 20 - Programming the Clock #1 Circuit:

Press the bottom button to scroll through "1", "2", "3", "4", "5", "6", "7", "8" & "9". Please refer to relay selection mode on page 21.

21--14

Option 21 - Once a Day Pulse - Set Hour:

This option is only available if "8" is selected in option 20 for once a day pulse. Press the bottom button to scroll through "00-23".

22--00

Option 22 - Once a Day Pulse - Set Minutes:

This option is only available if "8" is selected in option 20 for once a day pulse. Press the bottom button to scroll through "00-59".

23--30

Option 23 - Once a Day Pulse - Set Seconds:

This option is only available if "8" is selected in option 20 for once a day pulse. Press the bottom button to scroll through "00-59".

24--05

Option 24 - Once a Day Pulse - Set Duration (in seconds):

This option is only available if "8" is selected in option 25 for once a day pulse. Press the bottom button to scroll through "00-99".

User Level Programming

25--1

Option 25 - Programming the Clock #2 Circuit:

Press the bottom button to scroll through "1", "2", "3", "4", "5", "6", "7", "8" & "9". Please refer to relay selection mode on page 21.

26--14

Option 26 - Once a Day Pulse - Set Hour:

This option is only available if "8" is selected in option 25 for once a day pulse. Press the bottom button to scroll through "00-23".

27--00

Option 27 - Once a Day Pulse - Set Minutes:

This option is only available if "8" is selected in option 25 for once a day pulse. Press the bottom button to scroll through "00-59".

28--30

Option 28 - Once a Day Pulse - Set Seconds:

This option is only available if "8" is selected in option 25 for once a day pulse. Press the bottom button to scroll through "00-59".

29--05

Option 29 - Once a Day Pulse - Set Duration (in seconds):

This option is only available if "8" is selected in option 25 for once a day pulse. Press the bottom button to scroll through "00-99".

User Level Programming

30--1

Option 30 - Set the Primary Input:

Press the bottom button to scroll between "1-13" to select the input.

00 - Real Time Clock
01 - SNTP
02 - 59 Minute Correction
03 - 58 Minute Correction (1)
04 - 58 Minute Correction (2)
05 - 58 Minute Correction (3)
06 - 58 Minute Correction (4)
07 - National Time/Rauland

08 - Dukane
09 - Rauland Digital
10 - Wireless Repeater
11 - Once a Day Pulse*
12 - GPS
13 - RS485

* - Selecting this allows access to options 34-36

31--3

Option 31 - Set the Secondary Input:

This option is only available if "8" is selected in option 25 for once a day pulse. Press the bottom button to scroll through "00-23".

00 - Real Time Clock
01 - SNTP
02 - 59 Minute Correction
03 - 58 Minute Correction (1)
04 - 58 Minute Correction (2)
05 - 58 Minute Correction (3)
06 - 58 Minute Correction (4)
07 - National Time/Rauland

08 - Dukane
09 - Rauland Digital
10 - Wireless Repeater
11 - Once a Day Pulse*
12 - GPS
13 - RS485

* - Selecting this allows access to options 34-36

32--05

Option 32 - Setting the Time Zone Offset:

Press the bottom button to scroll through "-12 to 12". See Fig 3.1 on page 26 for examples of common offsets.

330000

Option 33 - Set the Bias Seconds + 7500 seconds to - 999 seconds:

This option allows the user to set the bias seconds which allows the user to adjust the input's time plus 7500 seconds or minus 999 seconds. Press the bottom button to scroll through "0000 - 7500".

34--01

Option 34 - Once a Day Pulse Input- Set Hour

This option is only available when option 30 or 31 is set to 11. Press the bottom button to scroll through "00-23".

User Level Programming

35--30

Option 35 - Once a Day Pulse Input - Set Minutes

This option is only available when option 30 or 31 is set to 11. Press the bottom button to scroll through "00-59".

36--00

Option 36 - Once a Day Pulse - Set Seconds

This option is only available when option 30 or 31 is set to 11. Press the bottom button to scroll through "00-59".

40--76

Option 40 - Last Time the Clock Received an Input Signal (in hours)

The display will be between 00 - 99. This option is read only. It cannot be modified.

44--01

Option 44 - Displays Status of Internet Connection:

A "01" will appear on the right side if the master is receiving an Internet Connection. A "00" will appear on the right side if it is not receiving an Internet Connection. This option is a read-only option.

45--0r

Option 45 - Crossover/Static IP option

If the right side says "off", DHCP is being used, if the user presses the bottom button, the display will change to "cr" which means crossover mode. In cross over mode, DHCP is turned off and the IP address is fixed at 192.168.0.123. Depressing the top button advances to the next menu item. Warning, after making a change, you must wait 20 seconds and power cycle for this change to take effect. Note that the PC directly connecting with this needs to be set for a fixed IP address which is not 192.168.0.123. For changing the IP address to a static IP, it must be done from the web interface. Please see page 22 for details.

User Level Programming

50--E

Option 50 - Entering Diagnostic Mode

Press the bottom button to scroll between "E - d". Setting the option to "E" will enable the option and will enter diagnostic mode. Setting the option to "d" will disable the option and upon depressing the top button, the clock will return to the time.

51--5

Option 51 - Sends Diagnostic to Slave Clock

Pressing the bottom button will scroll from "1-5 and 9".

01 - Protocol Verification
02 - Comprehensive Test
03 - Manufacturer's Default
04 - Combination of 02 & 03 (button must be pressed on SAM)
05 - Combination of 02 & 03 (no need to press button on SAM)
09 - Overrides the Previous Diagnostic and Goes Back to the Time

52--00

Option 52 - Set Duration (in minutes) that the Results of the Diagnostic will be Viewable on the Clock

Pressing the bottom button will scroll from "00-60". Pressing the top button will go back to the displayed time.

System Connections – Wired Systems

Sync-Wire Communication – Protocol Definitions

58th minute (1) The hourly correction for 55 seconds every hour from XX:58:05 to XX:59:00. The daily correction (5 a.m. & 5 p.m.) is ten correction cycles sent to the relay (each for 95 seconds) beginning at 5:05:00, 5:07:00, 5:09:00, 5:11:00, 5:13:00, 5:15:00, 5:17:00, 5:19:00, 5:21:00, and 5:23:00.

58th minute (2) The hourly correction for 60 seconds every hour from XX:58:00 to XX:59:00. The daily correction (5 a.m. & 5 p.m.) is twelve correction cycles sent to the relay (each for 65 seconds on and 25 seconds off) beginning at 5:05:00 to 5:22:35.

58th minute (3) The hourly correction for 60 seconds every hour from XX:58:00 to XX:59:00. The daily correction (5 a.m. & 5 p.m.) is twelve correction cycles sent to the relay (each for one minute on and two minutes off) beginning at 5:06:00.

58th minute (4) The hourly correction for 55 seconds every hour from xx:58:05 to XX:59:00. The daily correction (5 a.m. & 5 p.m.) is 12 correction cycles for 55 seconds. The timings will be 05:03:05, 05:07:05, 05:11:05, 05:15:05, 05:19:05, 05:23:05, 05:27:05, 05:31:05, 05:35:05, 05:39:05, 05:43:05 and 05:47:05.

59th minute The hourly correction for 8 seconds every hour from XX:57:54 to XX:58:02. The daily correction (5 a.m. & 5 p.m.) is a 14 second pulse from 5:57:54 to 5:58:08.

National Time & Rauland (1) The hourly correction is for 25 seconds every hour from XX:00:00 to XX:00:25. The daily correction (6 a.m. & 6 p.m.) is 25 seconds on, 35 seconds off every minute for 24 minutes.

National Time & Rauland (2) The hourly correction is for 25 seconds every hour from XX:00:00 to XX:00:25. This option only has hourly corrections.

Once a Day Pulse The Once a Day Pulse allows the user to manually configure when the relay will close and for how long it needs to close for.

Web Interface Programming

**The web interface is an optional feature and is not available on all units.
Please make sure that ports 123 and 80 are open on the firewall.**

Accessing the Web Interface (when connected via DHCP)

- 1) Plug in a patch cable to the unit, and then into a switch on your network.
- 2) Press the both buttons on the front of the display simultaneously, and then press them simultaneously once more. This puts the clock in the IP address view mode. The display will show the first 3 numbers of the IP address. Press both buttons simultaneously to see the second 3 digit portion of the IP address. Continue the same procedure for the third and fourth portions of the IP address. When finished, pressing both buttons together simultaneously will bring the time back onto the clock.
- 3) Open a web browser such as Internet Explorer or Firefox on a PC that's connected to the network.
- 4) In the address bar, type in the IP address and press Enter. This will access the log-in screen.

Accessing the Web Interface (when using a static IP)

- 1) Plug in a patch cable to the unit, and then into a switch on your network.
- 2) Set option 45 to "cr", as described on page 19.
- 3) Open a web browser such as Internet Explorer or FireFox on a PC that's connected to the network.
- 4) In the address bar, type in 192.168.0.123 and press Enter. This will access the log-in screen.
- 5) Once you are logged in, follow the instructions on page 28 for entering a new IP address.

Accessing the Web Interface (when using a crossover cable)

- 1) Set option 45 to "cr", as described on page 19.
- 2) If you are accessing this on a laptop, turn off any wireless connections.
- 3) Click the "Start" button on the taskbar, then click on "Control Panel".
- 4) Double Click on "Network Connections".
- 5) Click the right mouse button on "Local Area Connection" and click "Properties".
- 6) Scroll to the bottom of the connections list and single click on "Internet Protocol (TCP/IP)".
- 7) Click on "Properties".
- 8) Under the General tab, click the radio button that says "Use the following IP address".
- 9) Enter the IP address of "192.168.0.123".
- 10) Set the subnet mask to "255.255.255.0".
- 11) Click OK to accept the new changes, and then click OK again to exit the Network Connections screen.
- 12) Power cycle the master clock.
- 13) Open a web browser such as Internet Explorer or FireFox on a PC that's connected to the network.
- 14) In the address bar, type in the IP address (192.168.0.123) and press Enter. This will access the log-in screen.

❷ ❸

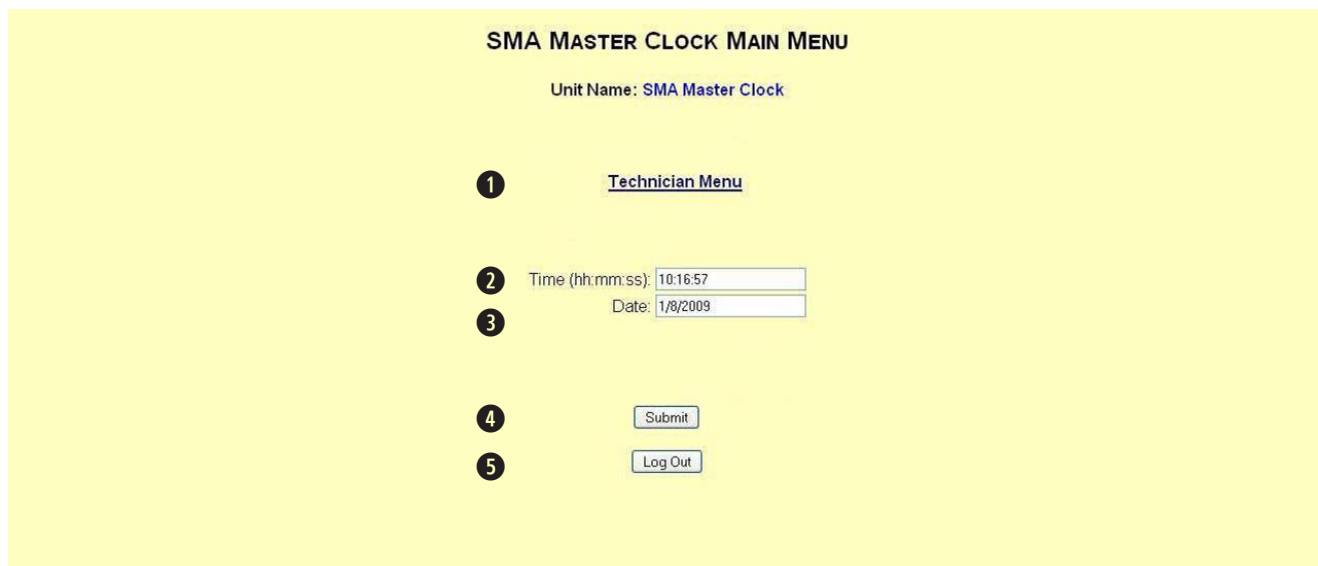

[Help page](#)

- ❶ **Password** There are two levels of passwords that will enable the user to access features. The first level is the user level programming that includes features like setting the time, date, adding and editing events and schedule changes. The default password for the user level is 1111. It can be changed in the technician level. The technician level password is 6063 and gives you full access to all of the enabled features of the master clock.
- ❷ **Log In** This button, when pressed, will attempt to log in to the master clock with the password that was entered in the field above.
- ❸ **Forgot Password** This button, when pressed, will direct you to the tech support phone number.

After five minutes of inactivity once logged in, the master clock will automatically log the user out.

System Settings Page 2

1 Input Selection This drop-down list allows the user to select which input will control the master clock. The choices are:

- | | | | |
|-------------------|--------------------|-------------------------|---------------------|
| • Real Time Clock | • 58 Minute Sync_1 | • National Time_Rauland | • Wireless Repeater |
| • GPS | • 58 Minute Sync_2 | • Dukane Digital | • RS485 |
| • SNTP | • 58 Minute Sync_3 | • Rauland Digital | |
| • 59 Minute Sync | • 58 Minute Sync_4 | • Once a Day Pulse | |

If Once a Day Pulse is selected, then fields for hours, minutes and seconds will appear. Enter the time (in 24 hour mode) that the clock is to go to when a once a day pulse is present. It must be a minimum of a two second pulse.

2 Backup Selection This drop-down list allows the user to select a backup input in case of the loss of the primary input. In order to use the Backup Selection, the following protocols cannot be used as both a primary and secondary input: 59 minute sync, 58 minute 1-4 sync, National Time/Rauland, Dukane Digital, Rauland Digital and once a day Pulse. An example of a configuration would be SNTP being the primary input and 58 minute correction being a secondary input. Setting the primary source to 59 minute sync and the secondary source to Dukane digital would be an incorrect configuration.

3 Clock #1 Circuit This drop-down list allows the user to select the sync-wire output for the Clock #1 circuit. The choices are:

- | | | |
|---------------------|----------------------------|----------------------------|
| • 59 Minute Sync* | • 58 Minute Sync_3* | • National Time_Rauland 2* |
| • 58 Minute Sync_1* | • 58 Minute Sync_4* | • Once a Day Pulse |
| • 58 Minute Sync_2* | • National Time_Rauland_1* | • Rauland Digital |

4 Clock #2 Circuit This drop-down list allows the user to select the sync-wire output for the Clock #2 circuit. See #3 above for the list of choices.

5 Reset All Setting to Default This button, when pressed, will revert all settings back to the default settings that were sent from the factory.

6 Submit This button, when pressed, will save all of the information to the master clock.

7 Cancel This button, when pressed, will clear out any changes made and will not save any data.

8 Menu This button, when pressed, will bring the user back to the main menu.

IP Address:

DNS Router:

DHCP:

Device Name:

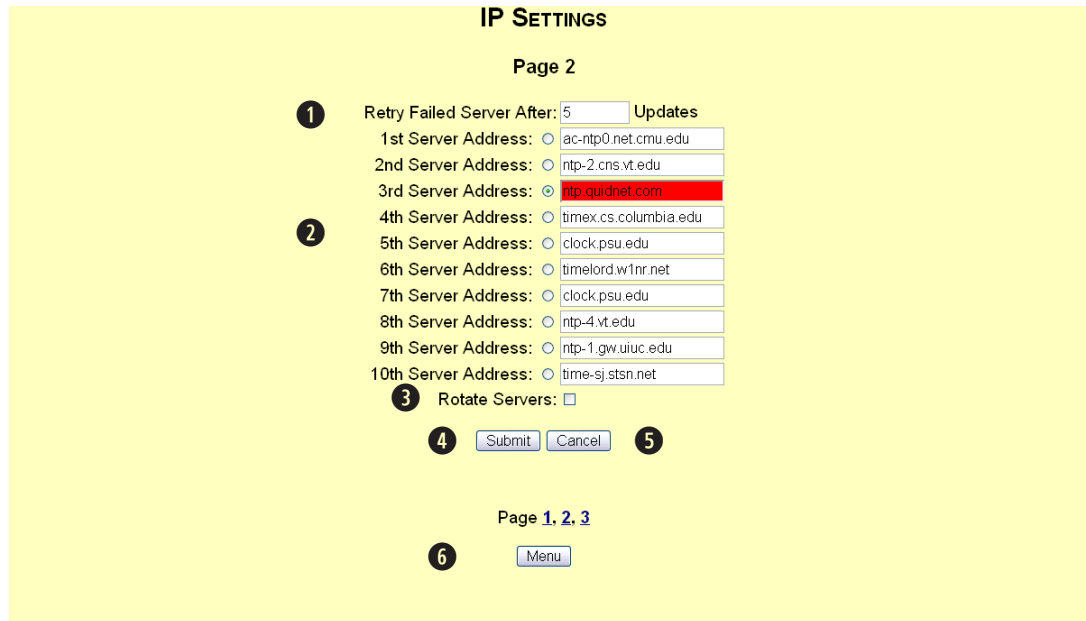

Page [1](#), [2](#), [3](#)

[Help page](#)

- 1 **Gateway IP Address** This field allows the user to set the Gateway IP address for the master clock.
- 2 **Subnet Mask** This field allows the user set the Subnet Mask for the master clock.
- 3 **IP Address** This field allows the user to set the IP address for the device.
- 4 **DNS Router** This field allows the user to set the DNS Router address. The default address will typically work for most applications, however some modification may be needed for certain networks.
- 5 **DHCP** This drop down list allows the user to turn DHCP on or off. DHCP allows the master clock to look for an IP address on its own if the network has a DHCP server.
- 6 **Device Name** This field allows the user to name the device a unique name.
- 7 **Submit** This button, when pressed, will save all of the information to the master clock.
- 8 **Cancel** This button, when pressed, will clear out any changes made and will not save any data.
- 9 **Menu** This button, when pressed, will bring the user back to the main menu.

Page 1, 2, 3

6 Menu

- 1 **Retry Failed-Server After** This field allows the user to specify how many times it will attempt to access the time from a server before it moves on to the next one.
- 2 **Server Addresses** This field allows the user to specify which NTP servers that the master clock will try to acquire time from. Any server that is highlighted in red is not functioning after several tries.
- 3 **Rotate Servers** This checkbox, when checked, allows the master clock to rotate through all the server addresses for constant time accuracy on a continual basis. There must be two server addresses for this option to work.
- 4 **Submit** This button, when pressed, will save all of the information to the master clock.
- 5 **Cancel** This button, when pressed, will clear out any changes made and will not save any data.
- 6 **Menu** This button, when pressed, will bring the user back to the main menu.

Clock Features

- ❶ **Display Format** This drop-down list allows the user to select whether they want 12 hour or 24 hour mode to be displayed on the LCD and LED.
- ❷ **Daylight Savings Time** This drop-down list allows the user to select which daylight savings time option they want. The option can be disabled, pre-2007 and post-2007. Pre-2007 has the old-style daylight savings time format that was enacted prior to 2007. Post-2007 daylight savings time is the current, newer format that is followed today.
- ❸ **Submit** This button, when pressed, will save all of the information to the master clock.
- ❹ **Cancel** This button, when pressed, will clear out any changes made and will not save any data.
- ❺ **Menu** This button, when pressed, will bring the user back to the main menu.

Restore Clock Database
Warning! this will overwrite any current configuration and force the clock to restart!
Please select a valid Database File:
2 No file chosen
3
4

- 1 **Upload Database** This button, when pressed, will upload the current schedules and events, and place it in a file for backup purposes.
- 2 **Choose File** This button, when pressed, will allow the user to browse for the saved .db file that contains the saved events and schedules.
- 3 **Download** This button, when pressed, will download the selected file and reset the master clock with those events and schedules already configured.
- 4 **Menu** This button, when pressed, will bring the user back to the main menu.

Support

Frequently Asked Questions

Does this master clock replace all of the existing master clocks made by Sapling?

The SMA Series will act as a direct replacement for the GPS, STR and SSM series master clocks. The SMA can have all the same functionalities of the aforementioned series depending on which options are ordered.

Can I use any SNTP server for downloading the time?

Yes, any site that sends out the SNTP protocol may be used as an input to the master clock.

What browsers are compatible with the SMA master clock browser?

The SMA browser is compatible with Microsoft Internet Explorer, Mozilla Firefox, Safari, Opera and Chrome.

Can I connect to the web browser through a cross-over cable?

Yes, the SMA can be accessed through a cross-over cable or via a LAN connection.

What is the maximum length I can go with the GPS cable?

When the GPS option is purchased, a 75 foot cable comes standard with the unit. This is Sapling's recommended longest distance.

Is there a Converter option like there was in the SSM and the GPS?

No, the Converter Box should be purchased separately from the unit when using a two wire digital communication system. The part number for the Converter Box is SCB-000-000-1.

What inputs can the SMA accept?

The SMA can accept an input from a SNTP server, 59 minute correction, four different versions of the 58 minute correction, National Time/Rauland, Dukane digital, Rauland digital, Sapling Wireless Repeater, Once a Day pulse, GPS and Sapling's RS485 protocol.

Support

Troubleshooting

The master clock will not power up. What do I do?

Make sure the power cord is securely connected to the power outlet and to the back of the SMA master clock. Upon being connected to power, the master clock should boot up instantly. There is not an on/off switch.

What do I do if I cannot connect to the browser?

Verify that the IP address your attempting to access is correct. If the IP address is correct, verify that there aren't any provisions in the firewall preventing you from accessing it. If all else fails, try connecting via a cross-over cable.

What do I do if the GPS isn't receiving a signal?

Check the antenna to make sure it is in an unobstructed area that is in complete view of the sky. Also, check to make sure the connections on each end of the cable are securely tightened. Lastly, verify that there are no kinks or breaks in the supplied GPS cable.

My sync-wire system doesn't seem to be getting the correct time. What should I do?

The clock 1 and clock 2 outputs control the sync-wire systems. Verify that the correct system is set for the designated clock circuit. Protocol details are listed on page 21.

Why didn't my SMA change for Daylight Savings Time?

A few things could cause the SMA not to change for Daylight Savings Time. The first item to check is the date to verify if it's correct. If the date is not correct, the clock will not change. If the date is correct, verify that the clock is set for the correct version of Daylight Savings Time. See page 15 for more information.
